

AN AMAZING CONCERT

It is known that there are many types of concerts depending on kind of music or artist's original style. Obviously, somebody's favourite band's performances seem to be something amazing. But is there anything extraordinary? It is really hard to find something like that in 21st century. It seems as if everything has already been invented. You probably don't expect anything surprising, but there is one thing. Vocaloids. These who are interested in Japanese culture must have heard of them, since they are really popular there. What are Vocaloids then? They are singing voice synthesizers. The release of the very first took place in 2004. Then, five years later, one of them had its first concert.

It was 22nd of August 2009, when the most popular Vocaloid performed live. It sounds confusing, doesn't it? An application software having a live concert? Well, Japan is quite popular for its weird ideas. How did they make it happen then? First of all, every voice synthesizer has own appearance projected. For example, the most popular one, Miku Hatsune, is an 158 cm tall girl with long turquoise hair. She was the one to perform first. Obviously, she was just a 3D hologram programmed to look as if it was singing and to dance at the same time. Surprisingly, there is usually a band on the stage and sometimes there are also dancers. However, the audience mostly cares about the Vocaloids.

I truly recommend checking it out to people interested in such unusual things.
